DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Topic 35
Domain Facets

- The **prerequisite** for following this (part of the) lecture is that you, as a domain engineer, need to know: *which are the constituents of a proper model of a domain?*

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- The **aims** are
  - ⋆ to introduce the concept that a proper domain description is made up from most of the following constituent descriptions:
    - ◇ business processes,
    - ◇ intrinsics,
    - ◇ supp.techns.,
    - ◇ mgt. & org.,
    - ◇ rules & regs.,
    - ◇ scripts,
    - ◇ human behaviour,
    - ◇ etc.,

    and
  - ⋆ to present principles, techniques and tools for the description of these facets.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- The **objective** is
  - ⋆ to ensure that you will become a thoroughly professional domain engineer.
- The **treatment** is from systematic to formal.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Introduction

- The lecture constitutes a first high point of the present lecture series,
- because in this lecture we present principles and techniques of software development
- that are not otherwise available in any other textbook on software engineering.
- So take your time to become thoroughly familiar with the contents of the present chapter.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Characterisation 11.174 By a *domain facet* we understand

- one amongst a finite set of generic ways
- of analysing a domain:
- a view of the domain,
- such that the different facets cover conceptually different views,
- and such that these views together cover the domain

. ■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- In this lecture we identify a number of *domain facets*
- and we survey principles and techniques for modelling, relative to identified domain stakeholder classes, each of the identified facets.
- So far we have been able to identify the following facets:
  - ⋆ *intrinsics*,
  - ⋆ *support technology*,
  - ⋆ *management and organisation*,
  - ⋆ *rules and regulations* including
  - ⋆ *script* facets, and
  - ⋆ *human behaviour*.

Springer
Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

- We enlarge upon the above enumeration using the following brief characterisations:
  - ⋆ **Domain intrinsics:**
    That which is common to all facets
  - ⋆ **Domain support technologies:**
    That in terms of which several other facets (intrinsics, business processes, management and organisation, and rules and regulations) are implemented

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- **Domain management and organisation:**
  That which primarily determines and constrains communication between enterprise stakeholders
- **Domain rules, regulations and scripts:**
  That which guides the work of enterprise stakeholders, their interaction, and the interaction with non-enterprise stakeholders

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

⋆ Domain human behaviour:

The way in which domain stakeholders dispatch their actions and interactions wrt. the enterprise: dutifully, forgetfully, sloppily, yes, even criminally

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

To help us identify parts of the above facets we suggest that rough sketch descriptions first be made of what we shall call the domain business process facilitators:

- **Domain business process facilitators:**
  Those processes — carried out primarily by people — in terms of which the intrinsics (and so on) are implemented

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Separation of Concerns

- We shall now treat each of these facets in some detail.
- For each we venture to express some specification pattern that most closely captures the essence of the facet.
- Separating the treatment of each of these (and possibly other) facets reflects the following principle:

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Principle 11.51 *Separation of Facets:* When possible, one should identify distinguishable facets and, when appropriate, i.e., if feasible and pleasing, treat them separately. ■

- We believe that the facets we shall present can be treated separately in most developments — but not necessarily always.
- *Separation or not* is a matter of development as well as of presentation style.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Discussion of the Separation Principle

- The separation, in more generality, of computing systems development into the triptych of
  - ⋆ domain engineering,
  - ⋆ requirements engineering and
  - ⋆ machine (hardware + software) design

  is also a result of separation of concerns.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- So are the separations of
  - ⋆ domain requirements,
  - ⋆ interface requirements and
  - ⋆ machine requirements

  (within requirements engineering),
- as well as the separation of
  - ⋆ software architecture and
  - ⋆ component and module design.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Topic 36

Domain Facilitators: Business Processes

- A domain is often known to its stakeholders by the various actions they play in that domain.
- That is, the domain is known by the various sequences of entities, functions and events the stakeholders are exposed to, are performing and are influenced by.
- Such sequences are what we shall here understand as business processes.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- In our ongoing example, that of railway systems, informal examples of business processes are:
  - ⋆ for a potential passenger to plan, buy tickets for, and undergo a journey.
  - ⋆ For the driver of the locomotive the sequence of undergoing a briefing of the train journey plan, taking possession of the train, checking some basic properties of that train, negotiating its start, driving it down the line, obeying signals and the plan, and, finally entering the next station, stopping at a platform, and concluding a trip of the train journey — all that constitutes a business process.
  - ⋆ For a train dispatcher, the monitoring and control of trains and signals during a work shift constitutes a business process.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11
DK-2840 Holte
Denmark
Tiergartenstraße 17
D 69121 Heidelberg
Germany

- Describing domain intrinsics focuses on the very essentials of a domain.
- It can sometimes be a bit hard for a domain engineer, in collaboration with stakeholders, to decide which are the domain intrinsics.
- It can often help (the process of identifying the domain intrinsics) if one alternatively, or hand in hand analyses and describes what is known as the business processes.
- From a description of business processes one can then analyse which parts of such a description designate, i.e., are about or relate to, which facets.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Principle 11.52 *Describing Domain Business Process Facets:*

- As part of understanding any (at least human–made) domain it is important to delineate and describe its business processes.
- Initially that should preferably be done in the form of rough sketches.
- These rough sketches should — again initially — focus on identifiable entities, functions, events and behaviours.
- Naturally, being business processes, identification of behaviours comes first.
- Then be prepared to rework these descriptions as other facets are being described in depth

.

■

Business Processes

Characterisation 11.175 By a *business process* we understand

- the procedurally describable aspects, of one or more of the ways in which a business, an enterprise, a factory, etc.,
- conducts its yearly, quarterly, monthly, weekly and daily processes, that is, regularly occurring chores.
  - ⋆ The processes may include strategic, tactical and operational management and workflow planning and decision activities; and
  - ⋆ the administrative, and where applicable, the marketing, the research and development, the production planning and execution, the sales and the service (workflow) activities — to name some

. ■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Example 11.126 *Some Business Processes:*

- A Business Plan Business Process:
  - ⋆ The board of any company instructs its chief executive officer (CEO) to formulate revised business plans.
  - ⋆ Briefly, a business plan is a plan for how the company strategically, tactically and, to some extent, operationally wishes to conduct its business: what it strives for, productwise, imagewise, market-share-wise, financially, etc.
  - ⋆ The CEO develops a business plan in consultation with executive layers of (i.e., with strategic) management.
  - ⋆ Strategic management (in-between) discusses the plan (which the CEO wishes to submit to the Board) with tactical management, etc.
  - ⋆ Once generally agreed upon, the CEO submits the plan to the Board.

© Dines Bjørner and © Springer
Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- A Purchase Regulation Business Process:
  - ⋆ In our "example company", purchase of equipment must adhere to the following — roughly sketched — process:
  - ⋆ Once the need for acquisition of one or more units of a certain equipment, or a related set of equipment, has been identified,
  - ⋆ the staff most relevant to take responsibility for the use of this equipment issues a **purchase inquiry request.**
  - ⋆ The **purchase inquiry request** is sent to the purchasing department.
  - ⋆ The purchasing department investigates the market and reports back with a **purchase inquiry report** containing facts about possible equipment choices, prices, and their purchase (i.e., payment), delivery, service and guarantee conditions.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- ⋆ The person who issued the **purchase inquiry request** may now proceed to issue a **purchase request order**, attach the **purchase inquiry report** and
- ⋆ send this to the relevant budget controlling manager for acceptance.
- ⋆ If purchase is approved then the purchasing department is instructed to issue, to the chosen supplier, a **purchase request order.**
- ⋆ Once the supplier delivers the ordered equipment, the purchasing department inspects the delivery and issues an **equipment inspection report.**
- ⋆ An **invoice** from the supplier for the above-mentioned equipment is only paid if the **equipment inspection report** recommends to do so.
- ⋆ Otherwise the delivered equipment is returned to the supplier.

• The above is but a rough sketch. Much more precision is needed, as are descriptions of exceptions, etc.

■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Example 11.127 *Some More Business Processes:*

- **Human Resources:** "Examine the hiring business process of the University, including the applicant process. Special emphasis should be given to simplifying the process, identifying those parts where there is no value added — i.e., where those parts of the process which one considers *simplifying "away"* add no value. Increase speed of response to applicant and units, and reduce process costs while achieving high quality."

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- **Renovation:** "Review the campus' remodelling and alterations business process, and develop recommendations to improve Facilities Management services to other departments for small projects (under $50,000) and minor capital projects (up to $250,000). Special emphasis should be given to simplifying the process, identifying those parts where there is no value added to the customer's product; to increase speed and flexibility of response; and to reduce process costs while achieving high quality."

© Dines Bjørner and © Springer
Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- **Procurement:** "Review the campus procurement business process and develop recommendations/solutions for process improvement. The redesigned process should provide "hassle-free" purchasing, give a quick response time to the purchaser, be economical in terms of all costs, be reasonably error-free and be compliant with (US) Federal procurement standards."

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- **Travel:** "Study the travel business process from the beginning stage when a faculty/staff member identifies the need to travel to the time when reimbursement is received. Analyze and redesign the process through a six step program based on the following business process improvement (BPI) principles: (i) simplify the process, (ii) identify those parts where there is no value added to the customer, increase (iii) speed and (iv) flexibility of response, (v) improve clarity for responsibilities and (vi) reduce process costs while meeting customer expectations from travel services. The redesign should reflect customer needs, service, economy of operation and be in compliance with applicable regulations."

© Dines Bjørner and © Springer
Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- **Accounts payable:** "Redesign the accounts payable business process to meet the following functional objectives (in addition to BPI measures): Payment for goods and services must assure that vendors receive remittance in a timely manner for all goods and services provided to the company. Significantly improve the operation's ability to serve company customers while maintaining financial solvency and adequate internal controls."

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- **Parking:** "Review how parking permits are sold to customers and staff with the intent of omitting unnecessary steps and redundant data collection. The redesigned process should achieve a dramatic reduction in time spent by people standing in line to purchase a permit, and reduce administrative time (and cost) in recording and tracking permit sales."

Please observe that the above examples illustrate requests for possible business process reengineering — but that they also give rough-sketch glimpses of underlying business processes. ■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Characterisation 11.176 By *business process engineering* we understand

- the identification of which business processes should be subject to precise description,
- describing these and securing their general adoption (acceptance) in the business, and
- enacting these business process descriptions

. ■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Example 11.128 *Example Business Process Engineering:*

- *Business plans:*
  - ⋆ We assume, about our example company, that — up to a certain time — there was no set procedure wrt. the creation, etc., of business plans.
  - ⋆ As the company grows, a need is felt for "stricter" procedures wrt. business plans.
  - ⋆ Therefore the CEO and/or the board drafts the business plan very implicitly hinted at in Example 11.126 first bullet.
  - ⋆ The last two sentences, above, portray an example business process engineering.

Fredsvej 11
DK-2840 Holte
Denmark
Tiergartenstraße 17
D 69121 Heidelberg
Germany

- *Purchase regulations:*
  - ⋆ We assume, about our example company, that — up to a certain time — there was no set procedure wrt. purchase of equipment.
  - ⋆ As the company grows, a need is felt for "stricter" procedures wrt. procurement.
  - ⋆ Therefore some (say, operations) manager drafts the purchase process roughly sketched in Example 11.126 second bullet (Foils 1035–1036).
  - ⋆ The previous two sentences portray an example business process engineering.

■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Overall Principles

We summarise:

Principles 11.53 • Human-made universes of discourse

- entail the concept of business processes.
- The principle of *business processes* states that the description of business processes is indispensable in any description of a human-made universe of discourse.
- The principle of *business processes* also states that describing these is not sufficient: all facets must be described

. ■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Technique 41 *Business Processes:* The basic technique of describing a human-made universe of discourse involves:

- identification and description of a suitably comprehensive set of *behaviours:* the behaviours of interest and the environment;
- identification and description, for each behaviour, of the *entities* characteristic of this behaviour;
- identification and description, for each entity, of the *functions* that apply to entities, or from which entities are yielded;
- identification and description, for each behaviour, of the *events* that it shares — either with other specifically identified behaviours of interest, or with a further, abstract, environment

. ■

Tools 11.14 *Business Processes:* Further techniques and the basic tools for describing business processes include:

- `RSL/CSP` definition of processes,
  - ⋆ where one suitably defines their *in*put/*out*put signatures,
  - ⋆ associated *channel* names and *type*s,
  - ⋆ and their process definition bodies;
- Petri nets;
- message and live sequence charts for the definition of interaction between behaviours;
- statecharts for the definition of highly complex, typically interwoven behaviours;
- and the usual, full complement of `RSL`'s *type*, function *value*, and *axiom* constructs and their abstract techniques for modelling entities and functions

. ■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Informal and Formal Examples

- We rough-sketch a number of examples.
- In each example we start, according to the principles and techniques enunciated above, with
  - ⋆ identifying behaviours, events, and hence
  - ⋆ channels and the
  - ⋆ type of entities communicated over channels, i.e. participating in events.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- Hence we shall emphasise, in these examples, the behaviour, or process diagrams.
- We leave it to other examples to present other aspects, so that their totality yields the principles, the techniques and the tools of domain description.

Denmark Germany

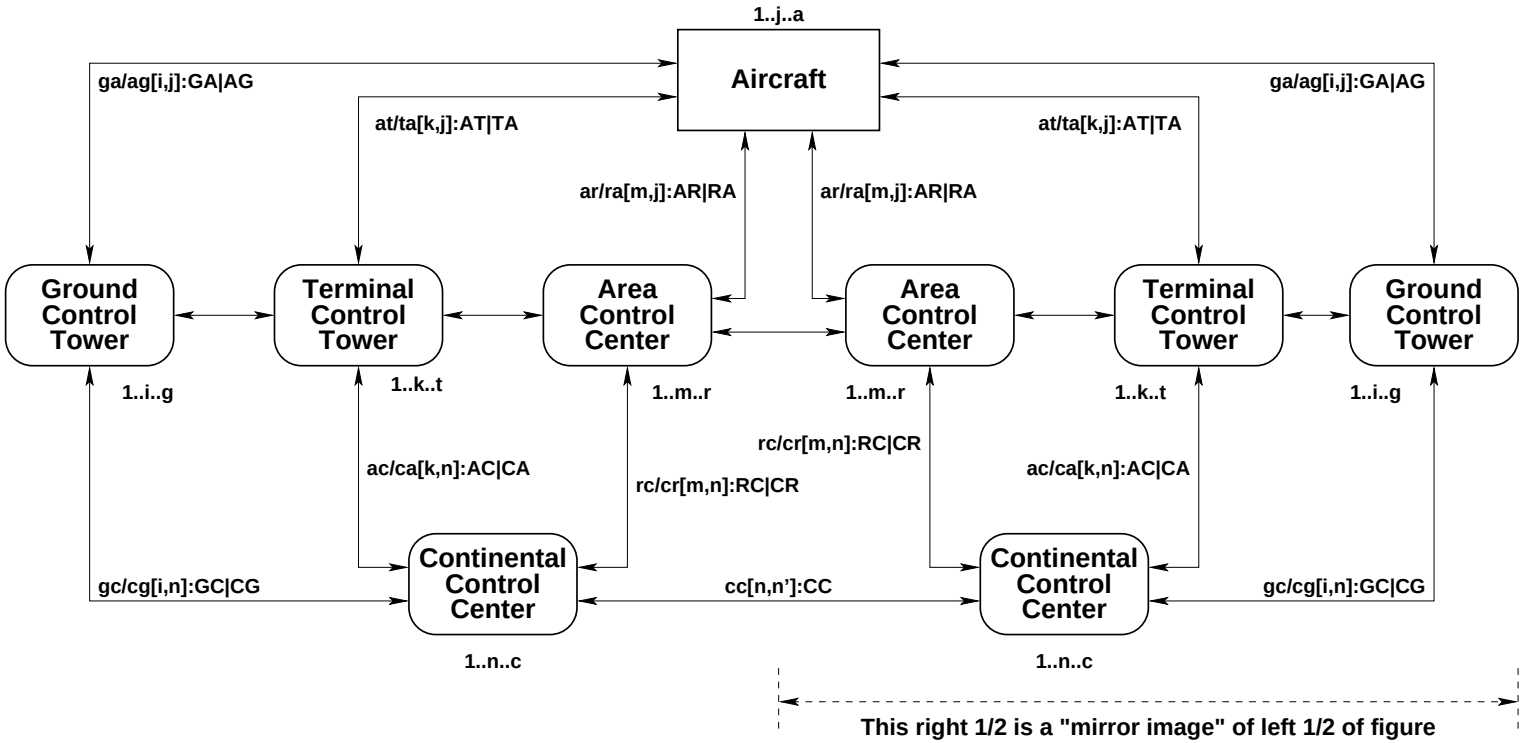

Figure 11.16: An air traffic behavioural system abstraction

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.129 *Air Traffic Business Processes:*

- The main business process behaviours of an air traffic system are the following:
  - ⋆ the aircraft,
  - ⋆ the ground control towers,
  - ⋆ the terminal control towers,
  - ⋆ the area control centres and
  - ⋆ the continental control centres
- (Fig. 11.16).

Springer
Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- We describe each of these behaviours separately:
  - ⋆ *Aircraft*
    - ◇ get permission from ground control towers to depart;
    - ◇ proceed to fly according to a flight plan (an entity);
    - ◇ keep in contact with area control centres along the route,
    - ◇ (upon approach) contacting terminal control towers from which they, simplifying, get permission to land; and
    - ◇ upon touchdown, changing over from terminal control tower to ground control tower guidance.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- ⋆ The ground control towers,
  - ◇ on one hand, take over monitoring and control of landing aircraft from terminal control towers;
  - ◇ and, on the other hand, hand over monitoring and control of departing aircraft to area control centres.
  - ◇ Ground control towers, on behalf of a requesting aircraft, negotiate with destination ground control tower and (simplifying) with continental control centres when a departing aircraft can actually start in order to satisfy certain "slot" rules and regulations (as one business process).
  - ◇ Ground control towers, on behalf of the associated airport, assign gates to landing aircraft, and guide them from the spot of touchdown to that gate, etc. (as another business process).

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- ⋆ The terminal control towers
  - ◇ play their major role in handling aircraft approaching airports with intention to land.
  - ◇ They may direct these to temporarily wait in a holding area.
  - ◇ They — eventually — guide the aircraft down, usually "stringing" them into an ordered landing queue.
  - ◇ In doing this the terminal control towers take over the monitoring and control of landing aircraft from regional control centres,
  - ◇ and pass their monitoring and control on to the ground control towers.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- ⋆ The area control centres handle aircraft flying over their territory:
  - ◇ taking over their monitoring and control
    - ○ either from ground control towers,
    - ○ or from neighbouring area control centres.
  - ◇ Area control centres shall help ensure smooth flight,
    - ○ that aircraft are allotted to appropriate air corridors, if and when needed (as one business process),
    - ○ and are otherwise kept informed of "neighbouring" aircraft and weather conditions en route (other business processes).
  - ◇ Area control centres hand over aircraft
    - ○ either to terminal control towers (as yet another business process),
    - ○ or to neighbouring area control centres (as yet another business process).

Springer
Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- ⋆ The continental control centres
  - ◇ monitor and control, in collaboration with
    - ○ regional and ground control centres,
  - ◇ overall traffic in an area comprising several regional control centres (as a major business process),
  - ◇ and can thus monitor and control whether contracted (landing) slot allocations and schedules can be honoured,
  - ◇ and, if not, reschedule these (landing) slots (as another major business process).

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- From the above rough sketches of behaviours the domain engineer then goes on to describe
  - ⋆ types of messages (i.e., entities) between behaviours,
  - ⋆ types of entities specific to the behaviours, and
  - ⋆ the functions that apply to or yield those entities.

■

Example 11.130 *Freight Logistics Business Processes:*

- The main business process behaviours of a freight logistics system are the following:
  - ⋆ the senders of freight,
  - ⋆ the logistics firms which plan and coordinate freight transport,
  - ⋆ the transport companies on whose conveyors freight is being transported,
  - ⋆ the hubs between which freight conveyors "ply their trade",
  - ⋆ the conveyors themselves and
  - ⋆ the receivers of freight
- (Fig. 11.17).
- A detailed description for each of the freight logistics business process behaviours listed above should now follow.
- We leave this as an exercise to the reader to complete.

■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

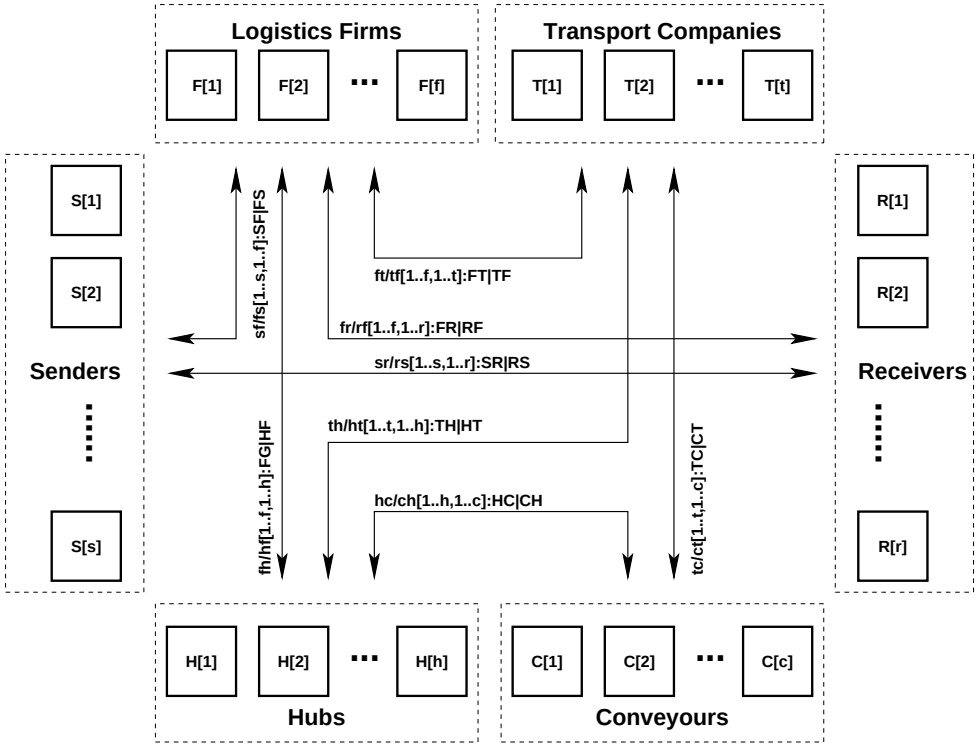

Figure 11.17: A freight logistics behavioural system abstraction

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Example 11.131 *Harbour Business Processes:*

- The main business process behaviours of a harbour system are the following:
  - ⋆ the ships who seek harbour to unload and load cargo at a harbour quay,
  - ⋆ the harbourmaster who allocates and schedules ships to quays,
  - ⋆ the quays at which ships berth and unload and load cargo (to and from a container area) and
  - ⋆ the container area which temporarily stores ("houses") containers
- (Fig. 11.18).

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- There may be other parts of a harbour:
  - ⋆ a holding area for ships
    - ◇ to wait before being allowed to properly enter the harbour and be berthed at a buoy or a quay,
    - ◇ or for ships to rest before proceeding; as well as
  - ⋆ buoys at which ships may be anchored while
    - ◇ unloading and loading.
- We shall assume that the course student can properly complete an appropriate, realistic harbour domain.
- A detailed description for each of the harbour business process behaviours listed above should now follow.
- We leave this as an exercise to the reader to complete.

■

Fredsvej 11 Tiergartenstraße 17

Example 11.132 *Financial Service Industry Business Processes:*

- The main business process behaviours of a financial service system are the following:
  - ⋆ clients,
  - ⋆ banks,
  - ⋆ securities instrument brokers and traders,
  - ⋆ portfolio managers,
  - ⋆ (the, or a, or several) stock exchange(s),
  - ⋆ stock incorporated enterprises and
  - ⋆ the financial service industry "watchdog".
- We rough-sketch the behaviour of a number of business processes of the financial service industry.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- ⋆ Clients engage in a number of business processes:
  - ◇ they open, deposit into, withdraw from, obtain statements about, transfer sums between and close demand/deposit, mortgage and other accounts;
  - ◇ they request brokers to buy or sell, or to withdraw buy/sell orders for securities instruments (bonds, stocks, futures, etc.); and
  - ◇ they arrange with portfolio managers to look after their bank and securities instrument assets, and occasionally they reinstruct portfolio managers in those respects.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- ⋆ Banks engage with clients, portfolio managers, and brokers and traders in exchanges related to client transactions with banks, portfolio managers, and brokers and traders, as well as with these on their own behalf, as clients.
- ⋆ Securities instrument brokers and traders engage with clients, portfolio managers and the stock exchange(s) in exchanges related to client transactions with brokers and traders, and, for traders, as well as with the stock exchange(s) on their own behalf, as clients.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- ⋆ Portfolio managers engage with clients, banks, and brokers and traders in exchanges related to client portfolios.
- ⋆ Stock exchanges engage with the financial service industry watchdog, with brokers and traders, and with the stock listed enterprises, reinforcing trading practices, possibly suspending trading of stocks of enterprises, etc.
- ⋆ Stock incorporated enterprises engage with the stock exchange: They send reports, according to law, of possible major acquisitions, business developments, and quarterly and annual stockholder and other reports.
- ⋆ The financial industry watchdog engages with banks, portfolio managers, brokers and traders and with the stock exchanges.

Discussion

- The course student is to be properly warned.
- An essence of the examples is not the specific diagrams shown,
- but that one can indeed draw such behavioural rough sketches.
- These can include
  - ⋆ square or rounded boxes designating behaviours;
  - ⋆ single- or, as here shown, double-ended arrows, designating the possibility of typed communication of messages (say over channels);
  - ⋆ the (entity) typing of these messages;
  - ⋆ and so on.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- Another essence of the examples is hence
  - ⋆ that there is a diagrammatic language of behaviours,
  - ⋆ and that this language has textual counterparts — say in the form of `CSP` or `RSL/CSP`.
- Other diagrammatic forms might be chosen, depending on properties not revealed in the above examples.
- These other forms might be Petri nets,
- message or live sequence charts, or, for example,
- statecharts.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- Furthermore, the examples
  - ⋆ are sketchy,
  - ⋆ but they provide an immediate, constructive start
  - ⋆ to the arduous task of carefully and painstakingly describing a domain.
- In all examples we have sketched the suggested arrays of channels and their types (as sorts).
  - ⋆ These are just suggestions.
  - ⋆ Interactions between behaviours are then modelled in terms of messages communicated over these channels.
  - ⋆ But such models are just that: there is no obligation on the part of any, subsequent software design to implement channels as something anywhere similar to channels!

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- The course student should understand that to describe domains fully satisfactorily requires
  - ⋆ at least the full complement of principles, techniques and tools
  - ⋆ covered in all chapters of Vols. 1 and 2,
  - ⋆ as well as in all the chapters up to and including all of the present chapter in this volume!

Summary

The purpose of first rough-sketching a number, not necessarily all, identifiable business processes is to use these descriptions to identify

- entities,
- events and
- functions,
- behaviours,

as well as to classify these into their "facethood":

- intrinsics,
- rules and regulations,
- support technologies,
- scripts and
- management and organisation,
- human behaviour.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Reminder

We remind the reader of the principle stated at the outset of this lecture on domain business process facets.

Principle 11.54 *Describing Domain Business Process Facets:*

- As part of understanding any (at least human–made) domain it is important to delineate and describe its business processes.
- Initially that should preferably be done in the form of rough sketches.
- These rough sketches should — again initially — focus on identifiable entities, functions, events and behaviours.
- Naturally, being business processes, identification of behaviours comes first.
- Then be prepared to rework these descriptions as other facets are being described in depth

.

■

Springer
Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- A main reason for initially describing the business processes of a domain
  - ⋆ is to discover, identify and capture entities, functions, events and behaviours of that domain.
- Another good reason
  - ⋆ is to get the process of description started — somewhere!

Topic 37
Domain Intrinsics

- Railways, although they have many "players and actors" revolve around some core notions: the rail net and trains on these.
- Overlapping groups of players and actors (i.e., stakeholders), hence different perspectives, in general, have a core of common entities and phenomena.
- We refer to this core as *the intrinsics of the domain.*

Principles 11.55 *Domain Intrinsics:* From the outset of describing a domain:

- Analyse it with respect to its intrinsic phenomena and concepts.
- Focus on describing these first.
- Make sure that the descriptions of subsequently described domain facets are subordinated descriptions of the domain facets

. ■

Principle 11.56 *Describing the Domain Intrinsics Facets:* So from the outset of describing a domain

- analyse it with respect to its intrinsic phenomena and concepts.
- Focus on describing these first, and
- make sure that the descriptions of all other (subsequently described) domain facets are subordinated descriptions of the domain intrinsics

.

Springer

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Overall Principles

- Each stakeholder group typically has its view of a domain.
- Different stakeholder groups may thus have different views of their — otherwise shared — domain.
- In developing a description of the domain intrinsics we must first develop one description per stakeholder group.
- Then, in some step of development, reconcile possible domain description inconsistencies and conflicts.
- To do so systematically we first need to form a basis,
- the intrinsics,
- which is common to all subsequent facets.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Characterisation 11.177 By domain *intrinsics* we shall understand

- those phenomena and concepts of a domain which are basic to any of the other facets (listed earlier and treated, in some detail, below),
- with such domain intrinsics initially covering at least one specific, hence named, stakeholder view

. ■

- In the next many examples we show typical fragments of rough-sketch or narrative descriptions —
- such as the software developer has to construct when creating a domain description.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.133 *Railway Net Intrinsics:* We narrate and formalise three railway net intrinsics.

- From the view of *potential train passengers*
  - ⋆ a railway net consists of lines, stations and trains.
  - ⋆ A line connects exactly two distinct stations.
- From the view of *actual train passengers*
  - ⋆ a railway net — in addition to the above —
  - ⋆ allows for several lines between any pair of stations
  - ⋆ and, within stations, provides for one or more platform tracks from which to embark or alight a train.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- From the view of *train operating staff*
  - ⋆ a railway net — in addition to the above —
  - ⋆ has lines and stations consisting of suitably connected rail units.
  - ⋆ A rail unit is either a simple (i.e., linear, straight) unit, or is a switch unit, or is a simple crossover unit, or is a switchable crossover unit, etc.
  - ⋆ Simple units have two connectors. Switch units have three connectors. Simple and switchable crossover units have four connectors.
  - ⋆ A path (through a unit) is a pair of connectors of that unit.
  - ⋆ A state of a unit is the set of paths, in the direction of which a train may travel. A (current) state may be empty: The unit is closed for traffic.
  - ⋆ A unit can be in either one of a number of states of its state space.

A summary formalisation of the three narrated railway net intrinsics could be:

- Different stakeholder perspectives,
- not only of intrinsics, as here,
- but of any facet,
- leads to a number of different models.
- The name of a phenomenon of one perspective, that is, of one model,
- may coincide with the name of a "similar" phenomenon of another perspective, that is, of another model, and so on.
- If the intention is that the "same" names cover comparable phenomena, then the developer must state the comparison relation.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.134 *Comparable Intrinsics:* We refer to Example 11.133. We claim that the concept of nets, lines and stations in the three models of Example 11.133 must relate. The simplest possible relationships are to let the third model be the common "unifier" and to mandate

- that the model of nets, lines and stations of the *potential train passengers* formalisation is that of nets, lines and stations of the *train operating staff* model; and
- that the model of nets, lines, stations and tracks of the *actual train passengers* formalisation is that of nets, lines, stations of the *train operating staff* model.

Thus the third model is seen as the definitive model for the stakeholder views initially expressed. ■

Springer
Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- In general the relationships to be expressed between different stakeholder models require more elaborate expressions.
- To express these formally, in RSL, we make use of RSL's *scheme* facility.
  - ⋆ More elaborate stakeholder schemes can be expressed by *extending* basic (i.e., intrinsic) schemes *with* additional types, values and axioms.
  - ⋆ The *hiding* facility of schemes can likewise be used to express different, but commensurate models.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- In the above description such things as lines, stations and units, including their particular kind (linear, switch, etc.) are phenomena, that is, they can be pointed to.
- Such things as connectors and paths could be considered either phenomena or concepts.
- Unit states and unit state spaces, including the idea of open and closed units, will here be considered concepts.
- The above example is only indicative.
- Much care must be taken to ensure that a description is consistent and complete.
- Care must also be taken to not describe phenomena or concepts that more properly belong to some other facets, as covered next.
- Identifying and describing intrinsics is also an art!

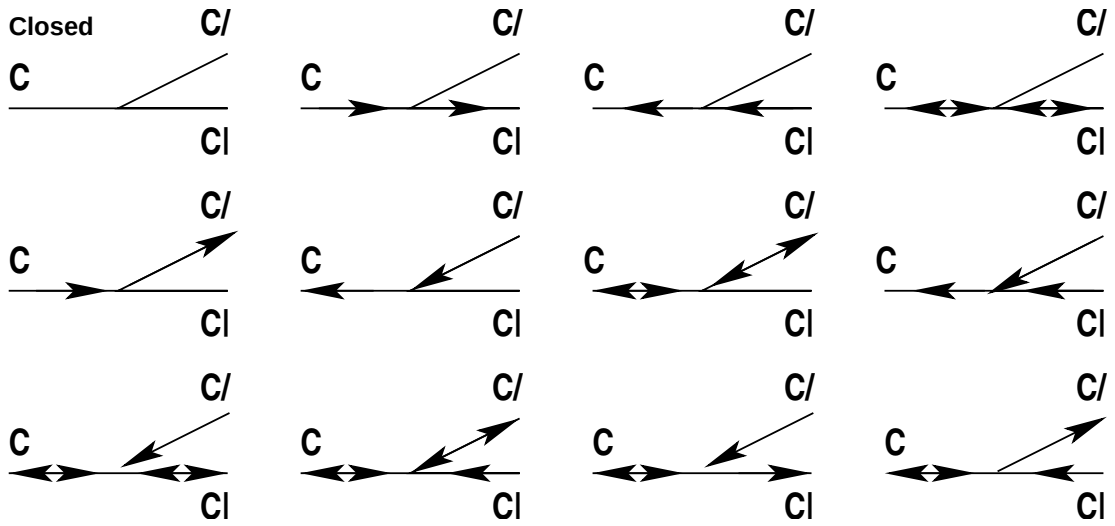

Figure 11.20: Possible states of a rail switch

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.135 *Intrinsics of Switches:*

- The intrinsic attribute of a rail switch is that it can take on a number of states.
- A simple switch $({}^{c_|}Y_{c}^{c_/})$ has three connectors: $\{c, c_|, c_/\}$. c is the connector of the common rail from which one can either "go straight" $c_|$, or "fork" $c_/$.
- So we have that a possible state space of such a switch could be ω_{g_s} :

$$\{\{\},$$
$$\{(c, c_|)\}, \{(c_|, c)\}, \{(c, c_|), (c_|, c)\},$$
$$\{(c, c_/)\}, \{(c_/, c)\}, \{(c, c_/), (c_/, c)\}, \{(c_/, c), (c_|, c)\},$$
$$\{(c, c_|), (c_|, c), (c_/, c)\}, \{(c, c_/), (c_/, c), (c_|, c)\}, \{(c_/, c), (c, c_|)\}, \{(c, c_/), (c_|, c)\}\}$$

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- The above models a general switch ideally.
- Any particular switch ω_{p_s} may have $\omega_{p_s} \subset \omega_{g_s}$.
- Nothing is said about how a state is determined:
  - ⋆ who sets and resets it,
  - ⋆ whether determined solely by the physical position of the switch gear,
  - ⋆ or also by visible or virtual (i.e., invisible, intangible) signals up or down the rail, away from the switch.

■

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Conceptual Versus Actual Intrinsics

- In order to bring an otherwise seemingly complicated domain across to the reader,
- one may decide to present it piecemeal:
  - ⋆ First, one presents the very basics, the fewest number of inescapable entities, functions and behaviours.
  - ⋆ Then, in a step of enrichment, one adds a few more (intrinsic) entities, functions and behaviours.
  - ⋆ And so forth.
  - ⋆ In a final step one adds the last (intrinsic) entities, functions and behaviours.

Fredsvej 11
DK-2840 Holte
Denmark
Tiergartenstraße 17
D 69121 Heidelberg
Germany

- In order to develop what initially may seem to be a complicated domain,
- one may decide to develop it piecemeal:
  - ⋆ We basically do as for the presentation steps:
  - ⋆ Steps of enrichments —
  - ⋆ from a big lie, via increasingly smaller lies, till one reaches a truth!

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.136 *Conceptual Intrinsics: Freight Transport:*

- The very essence of freight transport is:
  - ⋆ Entities: Senders, freight, "the system of transport", and receivers.
  - ⋆ Functions:
    - ◇ submitting an item of freight for transport, and
    - ◇ receiving an item of freight having been transported.
  - ⋆ Behaviour: Being transported.

Springer
Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

type
  Sndr, Frei, Rcvr
value
  submit: Sndr × Frei → System → System
  receiv: Rcvr → System → System × Frei
  transport: System → System

Observe that we have said nothing, really, about "the system of transport. ■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.137 *Actual Intrinsics: Freight Logistics:*

- We now elaborate on "the system of transport" alluded to in Example 11.136.
  - ⋆ The system entities are: harbours, bills of lading, ships and ship routes (from harbours to harbours).
    - ◇ We assume that there is no need to detail what are harbours, ships and ship routes.
    - ◇ A bill of lading is a document, say attached to a piece of freight, which stipulates properties of the freight (sender, receiver, origin of transport, destination of transport and route of transport: sequence of harbours and ships, sailing times, etc.).

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- ⋆ The system functions are:
  - ◇ submit a piece of freight to a harbour (of origin) indicating a receiver and a harbour of destination, and obtaining a bill of lading;
  - ◇ load a piece of freight from a harbour to a ship, as prescribed by that freight's bill of lading;
  - ◇ unload a piece of freight from a ship to a harbour, as prescribed by that freight's bill of lading;
  - ◇ fetching, by a receiver, a piece of freight from a destination harbour, as prescribed by that freight's bill of lading.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- ⋆ A system behaviour could be the sequence of one submission, one or more pairs of loadings and unloadings, ended by one fetch.
  - ◇ The above behaviour has abstracted "away" any notion of sailings,
  - ◇ i.e., of actual movement!

The formalisation, as does the narrative, only rough-sketches some intrinsics of freight logistics. ■

- We leave the two versions, the virtual and the "more realistic", further undefined.
- Both descriptions were kept in the form of rough sketches.
- The latter can take being further refined, i.e., made more precise.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Methodological Consequences

Principles 11.57 In any modelling one first forms and describes *intrinsic* facets. ■

Techniques 42
- The *intrinsics* model of a domain is a partial specification.
- As such, it involves the use of well-nigh all description principles.
- Typically we resort to property-oriented models, i.e., sorts and axioms

. ■

Discussion

- Thus the intrinsics become part of every one of the next facets.
- From an algebraic semantics point of view these latter are extensions of the above.
- We have presented a story of intrinsics as truthfully as we could.
  - ⋆ To decide on what is intrinsics and what is not is an art — it is a matter of choice, hence of style.
  - ⋆ There is no clear-cut criterion according to which a line of separation between intrinsics and nonintrinsics can be drawn.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Utter Barebones Intrinsics

- It was implied above that an absolute barebones intrinsics of railways was the atomic trains and the rail net abstracted to atomic lines and atomic stations.
- Similarly one could claim that an absolute barebones intrinsics of a hospital system was the atomic patients, atomic medical staff and atomic beds. Without the beds the first two kinds of entities would pass only for a physician's office.
- And similarly one could claim that an absolute barebones intrinsics for air traffic would be the aircraft, the airports and the air space.
- And so on.

- The reason we bring this concept of *utter barebones intrinsics* up is three-fold.
  - ⋆ First, the domain engineer must "think very hard" in trying to isolate, identify and capture the, or an utter barebones intrinsics of a domain.
  - ⋆ Secondly, the "more frugal" the domain engineer has been in selecting the utter barebones entities, functions, events and behaviours, the more time that domain engineer has to care about properly extending that utter barebones intrinsics with the remaining domain facets covered next.
  - ⋆ Thirdly, by "forcibly" trying to isolate an utter barebone intrinsics the domain engineer is actually trying to establish a scientific basis for the domain. The domain describer is more of a researcher than an engineer. This is basically untrodden land: few have tried to formulate domain descriptions let alone intrinsics, and very few, if any may have attempted to identify the utter barebones of a domain.
- We claim that it is a prerequisite for good domain descriptions to have tried to discover utter barebones intrinsics.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Reminder

We remind the reader of the principle stated at the outset of this lecture on domain intrinsics:

Principle 11.58 *Describing the Domain Intrinsics Facets:* So from the outset of describing a domain

- analyse it with respect to its intrinsic phenomena and concepts.
- Focus on describing these first, and
- make sure that the descriptions of all other (subsequently described) domain facets are subordinated descriptions of the domain intrinsics

. ■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Topic 38

Domain Support Technologies

- Technology is meant to support human activities.
- Usually technology replaces human actions one to one, i.e., rather directly.
- (That is, for one human action kind there is usually a substitute technology.)
- In other instances technology radically transforms the ways in which things are done.
- Hence:

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Principle 11.59 *Describing the Domain Support Technologies*

Facets: When describing a domain

- analyse it with respect to its support technology phenomena and concepts,
- focus on possibly describing these separately, and
- make sure that descriptions of other described domain facets are commensurate with possibly multiple, alternative descriptions of domain support technologies

. ■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Overall Principles

- In Example 11.133, we implied that a switch may take on a number of states:
- linking, into paths, suitable pairs of connectors, or none.
- But how such states came about was abstracted (away).

Characterisation 11.178 By domain *support technology* we shall understand

- ways and means of implementing certain observed phenomena

. ■

Fredsvej 11
DK-2840 Holte
Denmark
Tiergartenstraße 17
D 69121 Heidelberg
Germany

- The above characterisation is deliberately loose.
- It is so, so that we are not, later, constrained by a too tight characterisation.
- Therefore it is important to illustrate the idea,
- so as to aid the student's intuition,
- and thus enable proper identification and description of support technologies.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.138 *Railway Support Technology:* We give a rough sketch description of possible rail unit switch technologies.

- In "ye olde" days, rail switches were "thrown" by manual labour, i.e., by railway staff assigned to and positioned at switches.
- With the advent of reasonably reliable mechanics, pulleys and levers (and steel wires), switches were made to change state by means of "throwing" levers in a cabin tower located centrally at the station (with the lever then connected through wires etc., to the actual switch).
- This partial mechanical technology then emerged into electromechanics, and cabin tower staff was "reduced" to pushing buttons.
- Today, groups of switches, either from a station arrival point to a station track, or from a station track to a station departure point, are set and reset by means also of electronics, by what is known as interlocking (for example, so that two different routes cannot be open in a station if they cross one another).

■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- It must be stressed that Example 11.138 is just a rough sketch.
- In a proper narrative description the software (cum domain) engineer must describe, in detail, the subsystem of electronics, electromechanics and the human operator interface (buttons, lights, sounds, etc.).
- An aspect of supporting technology includes recording the state-behaviour in response to external stimuli.
- We give an example.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

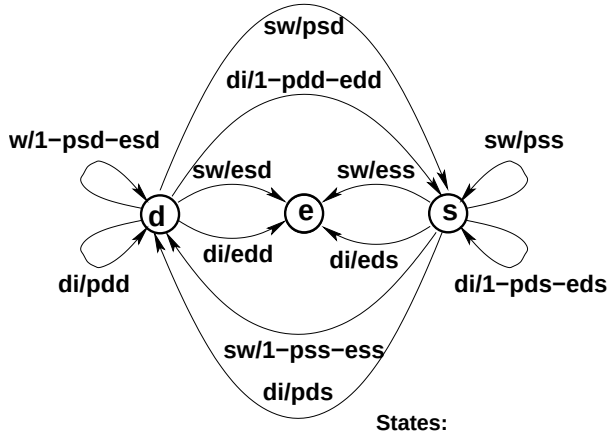
© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Example 11.139 *Probabilistic Rail Switch Unit State Transitions:*

- Figure 11.21 intends to model the probabilistic (erroneous and correct) behaviour of a switch when subjected to settings (to switched (s) state) and resettings (to direct (d) state).
- A switch may go to the switched state from the direct state when subjected to a switch setting s with probability psd.

■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany



Input stimuli:
- **sw: Switch to switched state**
- **di: Revert to direct state**

States:
- **s: Switched state**
- **d: Direct (reverted) state**
- **e: Error state**

Probabilities: 0 <= p.. <= 1
- **pss: Switching to switched state from switched state**
- **psd: Switching to switched state from direct state**
- **pds: Reverting to direct state from switched state**
- **pds: Reverting to direct state from direct state**
- **esd: Switching to error state from direct state**
- **edd: Reverting to error state from direct state**
- **ess: Switching to error state from switched state**
- **eds: Reverting to error state from switched state**

Figure 11.21: Probabilistic state switching

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Another example shows another aspect of support technology:

- Namely that the technology must guarantee certain of its own behaviours,
- so that software designed to interface with this technology,
- together with the technology, meets dependability requirements.

Example 11.140 *Railway Optical Gates:*

- Train traffic (itf:iTF), intrinsically, is a total function over some time interval, from time (t:T) to continuously positioned (p:P) trains (tn:TN).
- Conventional optical gates sample, at regular intervals, the intrinsic train traffic.
- The result is a sampled traffic (stf:sTF).
- Hence the collection of all optical gates, for any given railway, is a partial function from intrinsic to sampled train traffics (stf).
- We need to express quality criteria that any optical gate technology should satisfy — relative to a necessary and sufficient description of a closeness predicate.

- For all intrinsic traffics, **itf**, and for all optical gate technologies, **og**, the following must hold:
  - ⋆ Let **stf** be the traffic sampled by the optical gates.
  - ⋆ For all time points, **t**, in the sampled traffic,
  - ⋆ those time points must also be in the intrinsic traffic,
  - ⋆ and, for all trains, **tn**, in the intrinsic traffic at that time,
  - ⋆ the train must be observed by the optical gates, and
  - ⋆ the actual position of the train and the sampled position must somehow be checkable to be close, or identical to one another.

type
  T, TN
  P = U*
  NetTraffic == net:N trf:(TN $\overrightarrow{m}$ P)
  iTF = T → NetTraffic
  sTF = T $\overrightarrow{m}$ NetTraffic
  oG = iTF $\xrightarrow{\sim}$ sTF
value
  [close] c: NetTraffic × TN × NetTraffic $\xrightarrow{\sim}$ **Bool**
axiom
  ∀ itt:iTF, og:OG · **let** stt = og(itt) **in**
    ∀ t:T · t ∈ **dom** stt ·
      t ∈ $\mathcal{D}$ itt ∧ ∀ Tn:TN · tn ∈ **dom** trf(itt(t))
        ⇒ tn ∈ **dom** trf(stt(t)) ∧ c(itt(t),tn,stt(t)) **end**

Checkability is an issue of testing the optical gates when delivered for conformance to the **close**ness predicate, i.e., to the axiom. ■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.141 *Air Traffic Control:* We first refer to Example 11.129. Then we make the following remarks:

- The particular decomposition of air traffic control into the domain described, the ground, terminal, area and continental (monitoring and) control centres, represents but one composition of technologies.
  - ⋆ The pragmatics, i.e., the assumptions underlying that combined ground, terminal, area and continental control centre support technology is that all monitoring and control was to take place from the ground.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- Future technologies, easily implementable today, facilitate the following alternative "sum total" technologies:
  - ⋆ Most, if not all, of the human guidance that today takes place at these control centres can be automated and physically moved
    - ◇ either to fixed space-positioned satellites,
    - ◇ or to each aircraft itself.
  - ⋆ Intermediate support technologies shall then feature solutions that are intermediary to the present and the future support technologies.

■

Methodological Consequences

Techniques 43 • The *support technologies* model of a domain is a partial specification, hence all the usual abstraction and modelling principles, techniques and tools apply. More specifically,

- support technologies (st:ST) "implement" intrinsic contexts and states: $\theta_i : \Theta_i$ in terms of "actual" contexts and states: $\theta_a : \Theta_a$:

type

Θ_i, Θ_a

$\mathrm{ST} = \Theta_i \to \Theta_a$

axiom

$\forall$ sts:ST-**set**, st:ST $\cdot$ st $\in$ sts $\Rightarrow$ $\forall$ θ_i:Θ_i, $\exists$ θ_a:Θ_a $\cdot$ st(θ_i) = θ_a

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- The formal requirements can be narrated:
  - ⋆ Let Θ_i and Θ_a designate the spaces of intrinsic and actual-world configurations (contexts and states).
  - ⋆ For each intrinsic configuration model — that we know is support technology assisted —
  - ⋆ there exists a support technology solution,
  - ⋆ that is, a total function from all intrinsic configurations to corresponding actual configurations.
- If we are not convinced that there is such a function then there is little hope that we can trust this technology

.

■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- Support technology is not a refinement, but an extension.
- Support technology typically introduces considerations of
  - ⋆ technology accuracy reliability ⋆
  - ⋆ fault tolerance availability ⋆
  - ⋆ accessability safety ⋆
- Axioms characterise members of the set of support technologies (sts).
- An example axiom was given in the optical gate example (Example 11.140).

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Principles 11.60 The *support technology* principle is relative to all other domain facets.

- It expresses that one must first describe essential intrinsics.
- Then it expresses that support technology is any means of implementing concrete instantiations
  - ⋆ of some intrinsics,
  - ⋆ of some management and organisation,
  - ⋆ and/or of some rules and regulations,
  - ⋆ and so on

. ■

- Generally the principle states that one must always be on the look out for and inspire new support technologies.
- The most abstract form of the principle is: *What is a support technology one day becomes part of the domain intrinsics a future day.*

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Denmark Germany

Discussion

- The support technology descriptions reappear in the requirements definitions:
  - ⋆ as projected, instantiated, extended and initialised .
- In the domain description we only record our understanding of aspects of support technology failures.
- In the requirements definition we then follow up and make decisions as to which kinds of breakdowns the computing system, the machine, is to handle, and what is to be achieved by such handling.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Reminder

We remind the reader of the principle stated at the outset of this lecture on domain support technologies:

Principle 11.61 *Describing the Domain Support Technologies Facets:* When describing a domain

- analyse it with respect to its support technology phenomena and concepts,
- focus on possibly describing these separately, and
- make sure that descriptions of other described domain facets are commensurate with possibly multiple, alternative descriptions of domain support technologies

. ■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Topic 39

Domain Management and Organisation

- It is a basic characteristic of human-made systems
- that they are managed by humans
- and that their management and the managed are structured in organisational structures.
- This lecture is about how we model this facet.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Principle 11.62 *Describing the Domain Management and Organisation Facets:* When describing a domain

- analyse it with respect to its management and organisation phenomena and concepts.
- Focus on possibly describing these separately, and
- make sure that descriptions of other described domain facets are commensurate with possibly multiple, alternative descriptions of domain management and organisation

.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Overall Principles

- Activities of some (application) domains are made up by the actions of many people.
- It is therefore common to organise these into levels of management and many groups of "floor", i.e., nonmanagement staff.
- Railway systems are usually characterised by highly structured management organisations, and rules and regulations set up by upper echelons of management to be followed by lower levels and by ground staff and users.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Example 11.142 *Train Monitoring, I:*

- In China, as an example, rescheduling of trains occurs at stations and involves telephone negotiations with neighbouring stations ("up and down the lines").
- Such rescheduling negotiations, by phone, imply reasonably strict management and organisation (M&O). This kind of M&O reflects the geographical layout of the rail net.

■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Characterisation 11.179 By domain *management* we shall understand such people (such decisions)

- who (which) determine, formulate and thus set standards (cf. rules and regulations, a later lecture topic) concerning
  - ⋆ strategic, tactical and operational

  decisions;
- who ensure that these decisions are passed on to (lower) levels of management, and to floor staff;
- who make sure that such orders, as they were, are indeed carried out;

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

- who handle undesirable deviations in the carrying out of these orders cum decisions;
- and who "backstop" complaints from lower management levels and from floor staff

.

■

- In Example 9.95 we illustrated the distinctions indicated in the above characterisation of management between strategies, tactics and operations.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Characterisation 11.180 By domain *organisation* we shall understand

- the structuring of management and nonmanagement staff levels;
- the allocation of
  - ⋆ strategic,
  - ⋆ tactical and
  - ⋆ operational

  concerns to within management and nonmanagement staff levels;

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

- and hence the "lines of command":
  - ⋆ who does what, and
  - ⋆ who reports to whom,
    - ◇ administratively and
    - ◇ functionally

.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Example 11.143 *Railway Management and Organisation: Train Monitoring, II:*

- Certain (lowest-level operational and station-located) supervisors are responsible for the day-to-day timely progress of trains within a station and along its incoming and outgoing lines, and according to given timetables.
- These
  - ⋆ supervisors
  - ⋆ and their immediate (middle-level) managers (see below for regional managers)
- set guidelines (for local station and incoming and outgoing lines)
  - ⋆ for the monitoring of train traffic,
  - ⋆ and for controlling trains that are either ahead of or behind their schedules.

Springer
Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- By an incoming and an outgoing line we mean part of a line between two stations, the remaining part being handled by neighbouring station management.
- Once it has been decided, by such a manager, that a train is not following its schedule, based on information monitored by nonmanagement staff,
- then that manager directs that staff:
  - ⋆ to suggest a new schedule for the train in question, as well as for possibly affected other trains,
  - ⋆ to negotiate the new schedule with appropriate neighbouring stations, until a proper reschedule can be decided upon, by the managers at respective stations,
  - ⋆ and to enact that new schedule.
- A (middle-level operations) manager for regional traffic, i.e., train traffic involving several stations and lines, resolves possible disputes and conflicts.

■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- The above, albeit rough-sketch description, illustrated the following management and organisation issues:
  - ⋆ There is a set of lowest-level (as here: train traffic scheduling and rescheduling) supervisors and their staff.
  - ⋆ They are organised into one such group (as here: per station).
  - ⋆ There is a middle-level (as here: regional train traffic scheduling and rescheduling) manager (possibly with some small staff),
  - ⋆ organised with one such per suitable (as here: railway) region.
  - ⋆ The guidelines issued jointly by local and regional (...) supervisors and managers imply an organisational structuring of lines of information provision and command.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

A Conceptual Analysis, I

- People staff enterprises, the components of infrastructures with which we are concerned, i.e., for which we develop software.
- The larger these enterprises — these infrastructure components — the more need there is for management and organisation.
- The role of management is roughly twofold:

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

  - ⋆ first, to perform strategic, tactical and operational work, to set strategic, tactical and operational policies — and to see to it that they are followed.
  - ⋆ The role of management is, second, to react to adverse conditions, that is, to unforeseen situations, and to decide how they should be handled, i.e., conflict resolution.
- Policy setting should help nonmanagement staff operate normal situations — those for which no management interference is thus needed.
- And management "backstops" problems: management takes these problems off the shoulders of nonmanagement staff.

- To help management and staff know who's in charge wrt. policy setting and problem handling, a clear conception of the overall organisation is needed.
  - ⋆ Organisation defines lines of communication within management and staff, and between these.
  - ⋆ Whenever management and staff has to turn to others for assistance they usually, in a reasonably well-functioning enterprise, follow the command line: the paths of organigrams — the usually hierarchical box and arrow/line diagrams.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Methodological Consequences, I+II

Techniques 44 • The *management and organisation* model of a domain is a partial specification; hence all the usual abstraction and modelling principles, techniques and tools apply. More specifically,

- management is a set of predicates, observer and generator functions which either parameterise other, the operations functions, that is, determine their behaviour, or yield results that become arguments to these other functions

. ■

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Conceptual Analysis, II

- To relate classical organigrams to formal descriptions we first show such an organigram (Fig. 11.22),
- and then we show schematic processes which — for a rather simple scenario — model managers and the managed!

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

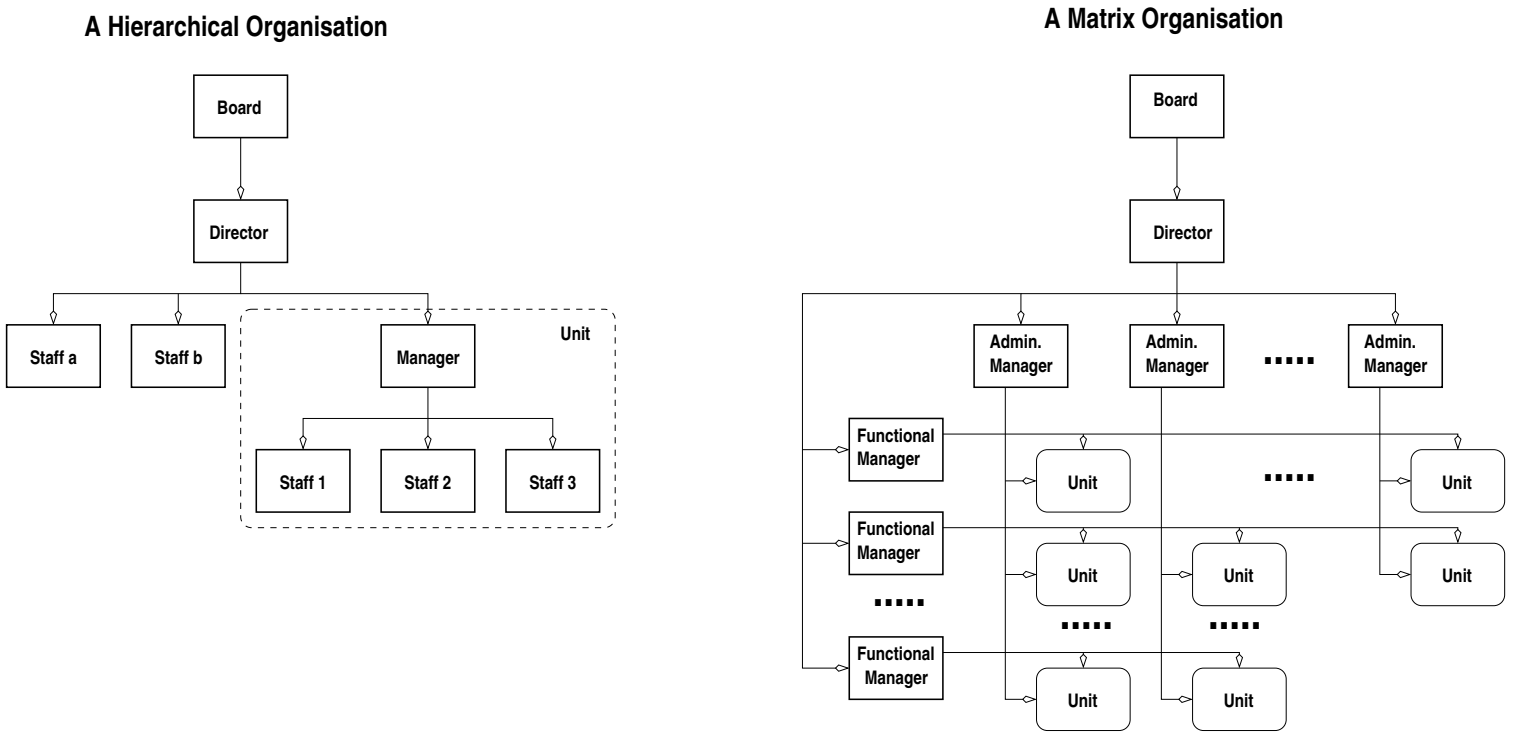

Figure 11.22: Organisational structures

- Based on such a diagram, and modelling only one neighbouring group of a manager and the staff working for that manager we get
  - ⋆ a **sys**tem in which one manager, **mgr**, and many staff, **stf**, coexist or work concurrently, i.e., in parallel.
  - ⋆ The **mgr** operates in a context and a state modelled by ψ.
  - ⋆ Each staff, **stf**(i) operates in a context and a state modelled by $\mathsf{s}\sigma(\mathsf{i})$.

- Both manager and staff processes recurse (i.e., iterate) over possibly changing states.
- The management process nondeterministically, external choice, "alternates" between "broadcast"-issuing orders to staff and receiving individual messages from staff.
- Staff processes likewise nondeterministically, external choice, alternate between receiving orders from management and issuing individual messages to management.
- The conceptual example also illustrates modelling stakeholder behaviours as interacting (here CSP-like) processes.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Methodological Consequences, III

- The *strategic, tactical and operations resource management* example of Example 9.95 (foils 808–826) illustrated another management and organisation description pattern.
  - ⋆ It is based on a set of, in this case, recursive equations.
  - ⋆ Any way of solving these equations, finding a suitable fix point, or an approximation thereof, including just choosing and imposing an arbitrary "solution", reflects some management communication.
  - ⋆ The syntactic ordering of the equations — in this case a linear passing of enterprise results from upper equations onto lower equations — reflects some organisation.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Principles 11.63 The *management and organisation* principle expresses that relations between resources, and decisions

- to acquire and dispose resources,
- to deschedule, reschedule and schedule resources,
- to deallocate, reallocate and allocate resources and
- to deactivate, reactivate and activate resources,

are ...

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

are

- the prerogatives of well-functioning management,
- reflect a functioning organisation and
- imply invocation of procedures that are modelled as actions that
  - ⋆ "set up"
  - ⋆ and "take down"

  contexts and change states.

As such, these principles tell us which subproblems of development to tackle. ■

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Techniques 45 *Management and Organisation:*

- We have already, under techniques for modelling stakeholder and stakeholder perspectives, mentioned some of the techniques.
- Two extremes were shown:
  - ⋆ Earlier we modelled individual management groups by
    - ◇ their respective functions (**strm**, **trm**, **orm**), and
    - ◇ their interaction (i.e., organisation) by solutions to a set of recursive equations!
- We can, amongst several styles, model management and organisation, especially the latter, by communicating sequential behaviours

.

■

Springer
Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Discussion

- The domain models of management and organisation eventually find their way into requirements and, hence, the software design —
- for those cases in which the requirements are about computing support of management and its organisation.
- Support in the solution of the recursive equations of the earlier stakeholder example (Example 9.95 Resource Management) may be offered in the form of constraint-satisfaction solvers.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- These may partially handle logic characterisations of the strategic and tactical management functions.
- They might then do so in the form of computerised support of message passing between the various management groups (of, for example, that stakeholder example), as well as of the generic example of the present part.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Reminder

We remind the reader of the principle stated at the outset of this lecture on domain management and organisation:

Principle 11.64 *Describing the Domain Management and Organisation Facets:* When describing a domain

- analyse it with respect to its management and organisation phenomena and concepts.
- Focus on possibly describing these separately, and
- make sure that descriptions of other described domain facets are commensurate with possibly multiple, alternative descriptions of domain management and organisation

. ■

Topic 40

Domain Rules and Regulations

- Railway systems, for example, are characterised by large varieties of rules for appropriate behaviour of:
  - ⋆ trains,
  - ⋆ train dispatch,
  - ⋆ monitoring and control,
  - ⋆ supporting technology,
  - ⋆ and hence of humans at all levels.
- This is also true for most other systems that we might care to consider.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- When rules are broken regulations take effect:
  - ⋆ Humans may be disciplined,
  - ⋆ and activities of the domain may be adjusted.

Principle 11.65 *Describing the Domain Rules and Regulations Facets:* When describing a domain

- analyse it with respect to its rules and regulations phenomena and concepts.
- Focus on possibly describing these separately, and
- make sure that the descriptions of other domain facets are commensurate with possibly multiple, alternative descriptions of domain rules and regulations

. ■

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Overall Principles

- Earlier, when we dealt with management and organisation, it was hinted that management may issue certain guidelines.
- We now look at a special class of these.

Characterisation 11.181 By a domain *rule* we shall understand

- some text (in the domain) which prescribes how people or equipment are expected to behave when dispatching their duty, respectively when performing their function

. ■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Characterisation 11.182 By a *domain regulation* we shall understand

- some text (in the domain) which prescribes what remedial actions are to be taken when it is decided that a rule has not been followed according to its intention

. ■

- Rules are like one part of a law: *Thou shalt!*
- Regulations are like another part of a law: *If you break this law "thou" can expect the following punishment!*

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

- Rules and regulations are set
  - ⋆ by enterprises,
  - ⋆ by equipment manufacturers,
  - ⋆ by enterprise associations,
  - ⋆ by [government] regulatory agencies,
  - ⋆ and by society (the latter in the form of laws).
- Adherence to rules is likewise monitored by these or similar institutions.
- Enforcement of (i.e., the imposition of what is specified in) regulations is similarly ensured by these or similar institutions.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Example 11.144 *Trains at Stations:*

- Rule:
  - ⋆ In China the arrival and departure of trains at, respectively from, railway stations is subject to the following rule:
  - ⋆ *In any three-minute interval at most one train may either arrive to or depart from a railway station.*
- Regulation:
  - ⋆ *If it is discovered that the above rule is not obeyed*, then there is some regulation which prescribes administrative or legal management and/or staff action, as well as some correction to the railway traffic.

■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.145 *Trains Along Lines:*

- Rule:
  - ⋆ In many countries railway lines (between stations) are segmented into blocks or sectors. The purpose is to stipulate that if two or more trains are moving along the line, then:
  - ⋆ *There must be at least one free sector (i.e., without a train) between any two trains along a line.*
- Regulation:
  - ⋆ *If it is discovered that the above rule is not obeyed*, then there is some regulation which prescribes administrative or legal management and/or staff action, as well as some correction to the railway traffic.

■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- It is, as for all other domain facets, crucially important that rules and regulations are captured and precisely described —
- as we often shall find that requirements of software
  - ⋆ either assume these rules to hold,
  - ⋆ or expect such rules to be enforced.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Methodological Consequences

Techniques 46 *Rules and Regulations:*

- There are, abstractly speaking, usually three kinds of languages involved wrt. (i.e., when expressing) rules and regulations (respectively when invoking actions that are subject to rules and regulations).
  - ⋆ Two languages, Rules and Reg, exist for describing rules, respectively regulations; and
  - ⋆ one, Stimulus, exists for describing the form of the [always current] domain action stimuli.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- A syntactic stimulus, sy_sti, denotes a function, se_sti:STI: $\Theta \rightarrow \Theta$, from any configuration to a next configuration
- A syntactic rule, sy_rul:Rule, has as its semantics, its meaning, rul:RUL,
  - ⋆ a predicate over current and next configurations, $(\Theta \times \Theta) \rightarrow$ **Bool**,
  - ⋆ where these next configurations have been caused, by the stimuli. These stimuli express:
  - ⋆ If the predicate holds then the stimulus will result in a valid next configuration.

- A syntactic regulation, sy_reg:Reg (related to a specific rule), stands for, i.e., has as its semantics, its meaning,
  - ⋆ a semantic regulation, se_reg:REG,
  - ⋆ which is a pair.
  - ⋆ This pair consists of
    - ◇ a predicate, pre_reg:Pre_REG, where Pre_REG = $(\Theta \times \Theta) \rightarrow$ **Bool**,
    - ◇ and a domain configuration-changing function, act_reg:Act_REG, where Act_REG = $\Theta \rightarrow \Theta$,
    - ◇ that is, both involving current and next domain configurations.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- ⋆ The two kinds of functions express:
  - ◇ If the predicate holds,
  - ◇ then the action can be applied.
- The predicate is almost the inverse of the rules functions.
- The action function serves to undo the stimulus function.

  interpret: Reg → REG

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

- The idea is now the following:
  - ⋆ Any action of the system, i.e., the application of any stimulus,
    - ◇ may be an action in accordance with the rules,
    - ◇ or it may not.
  - ⋆ Rules therefore express whether stimuli are valid or not in the current configuration.
  - ⋆ And regulations therefore express whether they should be applied, and, if so, with what effort.

- More specifically,
  - ⋆ there is usually, in any current system configuration, given a set of pairs of rules and regulations.
  - ⋆ Let (sy_rul,sy_reg) be any such pair.
  - ⋆ Let sy_sti be any possible stimulus.
  - ⋆ And let θ be the current configuration.
  - ⋆ Let the stimulus, sy_sti, applied in that configuration result in a next configuration, θ', where $\theta' = (\mathsf{meaning}(\mathsf{sy\_sti}))(\theta)$.
  - ⋆ Let θ' violate the rule, $\sim\mathsf{valid}(\mathsf{sy\_sti},\mathsf{sy\_rul})(\theta)$,
  - ⋆ then if predicate part, pre_reg, of the meaning of the regulation, sy_reg, holds in that violating next configuration, $\mathsf{pre\_reg}(\theta,(\mathsf{meaning}(\mathsf{sy\_sti}))(\theta))$,
  - ⋆ then the action part, act_reg, of the meaning of the regulation, sy_reg, must be applied, $\mathsf{act\_reg}(\theta)$, to remedy the situation.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- It may be that the regulation predicate fails to detect applicability of regulations actions.
- That is, the interpretation of a rule differs, in that respect, from the interpretation of a regulation.
- Such is life in the domain, i.e., in actual reality

.

- We have given an outline of the basic conditions under which a set of rules and regulations must be designed.
- Whether they are, in actual life, designed, by people, and to be interpreted and followed by people, as described here is not for us to decide.
- Such concerns are the prerogatives of business process reengineering and domain requirements
- We will cover such concerns in later lectures.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Rules and Regulation Languages

- We have outlined the basic properties any set of rules and regulations must imply in a properly functioning organisation.
- The axioms prescribed above are abstract.
- They also apply, inter alia, to natural language expressions of rules and regulations.
- It would be nice if rules and regulations could be formalised.
- Then, given an appropriate model of the domain, one might be able to analyse the consistency and completeness of rules and regulations with respect to the domain model.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- It is inside the scope, but outside the span of these lectures to bring in — as of 2006 — research material on this subject.
- In other words: Expect it to come, one day, probably couched in terms of some modal logics of knowledge and belief, and/promise and commitment, etc.
- We refer to the nice book by Fagin, Halpern, Moses and Vardi: *Reasoning About Knowledge*.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- Essentially, the issues are:
  - ⋆ first, to design and use languages (one or more, **Rul**, **Reg**),
  - ⋆ with proper, possibly modal constructs,
  - ⋆ for expressing rules and regulations.
  - ⋆ Second, we need to compile such expressions of rules and regulations.
  - ⋆ Finally, we need to let a computer check "all the time" whether stimuli (whether human or otherwise generated) might cause
  - ⋆ transitions that may result in violations of the rules.

Principles and Techniques

Principle 11.66 *Rules and Regulations:* Domains are governed by rules and regulations: by laws of nature or edicts by humans.

- Laws of nature
  - ⋆ can be part of intrinsics,
  - ⋆ or can be modelled as rules and regulations constraining the intrinsics.
- Edicts by humans
  - ⋆ usually change,
  - ⋆ but are normally considered part of an irregularly changing context,
  - ⋆ not a recurrently changing state.

Modelling techniques follow these principles. ■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Techniques 47 • *Rules and regulations*, in the domain, are therefore domain-modelled

- ⋆ by abstract or concrete syntaxes of syntactic rules,
- ⋆ by abstract types of denotations and
- ⋆ by semantics definitions, usually in the form of axioms or denotation-ascribing functions.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- Such rules and regulations modelling must allow for conflicts between rule and regulation interpretations:
  - ⋆ that rules are interpreted to state that a next configuration is not valid,
  - ⋆ while a regulation (applicability) predicate does not hold.
- Stimuli, without here going into details, may be modelled by nondeterministic external events, i.e., CSP-like inputs

.

DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Reminder

We remind the reader of the principle stated at the outset of this lecture on domain rules and regulations:

Principle 11.67 *Describing the Domain Rules and Regulations Facets:* When describing a domain

- analyse it with respect to its rules and regulations phenomena and concepts.
- Focus on possibly describing these separately, and
- make sure that the descriptions of other domain facets are commensurate with possibly multiple, alternative descriptions of domain rules and regulations

. ■

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Topic 41
Domain Scripts

- Usually rules and regulations form a contract between levels of staff in an enterprise.
- We may call these intrainstitutional rules and regulations.
- Rules that pertain
  - ⋆ to contracts between, say, a private enterprise and its customers, or a government and its citizens,
  - ⋆ often need be far more stringently phrased than intrainstitutional rules and regulations.
- We may call such rules legal rules and regulations.
- Legal rules and regulations often need be scripted.

Principle 11.68 *Describing the Domain Script Facets:* When describing a domain

- analyse it with respect to its script phenomena and concepts.
- Focus on possibly describing these separately, and
- make sure that descriptions of other described domain facets are commensurate with possibly multiple, alternative descriptions of domain scripts

.

Springer
Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

The Description of Scripts

Characterisation 11.183 By a domain *script* we shall understand

- the structured, almost, if not outright, formally expressed, wording of
- a rule or a regulation that has legally binding power,
- that is, which may be contested in a court of law

.

■

- Scripts are like programs.
  - ⋆ They are expected to prescribe step-by-step actions to be applied
  - ⋆ in order to determine whether a rule should be applied,
  - ⋆ and, if so, exactly how it should be applied.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Example 11.146 *A Casually Described Bank Script, I:* We deviate, momentarily, from our line of railway examples, to exemplify one from banking. Our formulation amounts to just a (casual) rough sketch. It is followed by a series of four large examples. Each of these elaborate on the theme of (bank) scripts.

- The problem area is that of how repayments of mortgage loans are to be calculated.
  - ⋆ At any one time a mortgage loan has
    - ◇ a balance,
    - ◇ a most recent previous date of repayment,
    - ◇ an interest rate and
    - ◇ a handling fee.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

- ⋆ When a repayment occurs, then the following calculations shall take place:
  - ◇ the interest on the balance of the loan since the most recent repayment,
  - ◇ the handling fee, normally considered fixed,
  - ◇ the effective repayment
    - ○ — being the difference between the repayment
    - ○ and the sum of the interest and the handling fee —
  - ◇ and the new balance,
    - ○ being the difference between the old balance
    - ○ and the effective repayment.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- ⋆ We assume repayments to occur from a designated account, say a demand/deposit account.
- ⋆ We assume that bank to have designated fee and interest income accounts.
- ⋆ The interest is subtracted from the mortgage holder's demand/deposit account and added to the bank's interest (income) account.
- ⋆ The handling fee is subtracted from the mortgage holder's demand/deposit account and added to the bank's fee (income) account.
- ⋆ The effective repayment is subtracted from the mortgage holder's demand/deposit account and also from the mortgage balance.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- ⋆ Finally, one must also describe deviations such as
  - ◇ overdue repayments,
  - ◇ too large, or too small repayments,
  - ◇ and so on.

■

- The idea about scripts is that they can somehow be objectively enforced:
  - ⋆ that they can be precisely understood
  - ⋆ and consistently carried out by all stakeholders,
  - ⋆ eventually leading to computerisation.
  - ⋆ But they are, at all times, part of the domain.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Example 11.147 *Bank Scripts, II:*

- Without much informal explanation, i.e., narrative, we define a small bank.
  - ⋆ One can open and close demand/deposit accounts.
  - ⋆ One can obtain and close mortgage loans, i.e., obtain loans.
  - ⋆ One can deposit into and withdraw from demand/deposit accounts.
  - ⋆ And one can make payments on the loan.
- In this example we illustrate informal rough-sketch scripts
- while also formalising these scripts.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- One can only close a mortgage account if it has been paid down (to 0 balance).
- If so, the loan is deregistered, the account removed and the client given an OK.
- If not paid down the bank state does not change, but the client is given a NOT OK.
- It is checked that the client is a bona fide loan client and presents a bona fide mortgage account number.

- To pay off a loan is to pay the interest on the loan since the last time interest was paid.
- That is, interest, i, is calculated on the balance, b, of the loan for the period $d' - d$, at the rate of mi.
- (We omit defining the interest computation.)
- The payment, p, is taken from the client's demand/deposit account, a; i is paid into a bank (interest earning account) a_i and the loan is diminished with the difference $p - i$.
- It is checked that the client is a bona fide loan client and presents a bona fide mortgage account number.
- The bank well-formedness condition should be made to reflect the existence of account a_i.

Example 11.148 *Bank Scripts, III:*

- From each of the informal/formal bank script descriptions
- we systematically "derive" a script in a possible bank script language.
- The derivation, for example, for how we get from the formal descriptions of the individual transactions to the scripts in the "formal" bank script language is not formalised.
- In this example we simply propose
- possible scripts in the formal bank script language.

Methodological Consequences

- We have already covered
  - ⋆ techniques for,
  - ⋆ and principles of
- describing (i.e., modelling) rules and regulations (Sects. and).
- These carry over, but in stricter forms, to the description (incl. modelling) of scripts.
- Designing script languages is basically like designing small programming languages.
- In other lecture series we have outlined a long series of principles, techniques and tools for designing such languages, including specifying their syntax, semantics and pragmatics.

Fredsvej 11, DK-2840 Holte, Denmark
Tiergartenstraße 17, D 69121 Heidelberg, Germany

Reminder + More

We remind the reader of the principle stated at the outset of this lecture on domain scripts.

Principle 11.69 *Describing the Domain Script Facets:* When describing a domain

- analyse it with respect to its script phenomena and concepts.
- Focus on possibly describing these separately, and
- make sure that descriptions of other described domain facets are commensurate with possibly multiple, alternative descriptions of domain scripts

.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Techniques 48 *Domain Scripts:* To properly develop domain scripts, the full force of the semiotic concepts of pragmatics, semantics and syntax, and the techniques of language definition as covered extensively in other lectures, apply. ■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11
DK-2840 Holte
Denmark
Tiergartenstraße 17
D 69121 Heidelberg
Germany

Tools 11.15 *Domain Scripts:* Many tools exist for language design and compiler implementation. Some deal with analysis of syntactic and semantic descriptions. Others deal with the automatic generation of lexical scanners, error-correcting parser generators, and yet others with interpreter and compiler generation. We refer to standard textbooks on compiler implementation. Search the Internet and you will find many references to downloadable compiler construction tools.

Topic 42
Domain Human Behaviour

- Let us consider the staff of any enterprise, any place of work, whether private or public.
  - ⋆ Some go about doing their job conscientiously: diligently carrying out tasks as expected.
  - ⋆ Other staff unconsciously sometimes forget: are sometimes a bit sloppy in the dispatch of duties.
  - ⋆ Yet other staff set themselves lower standards for the pursuit of their assignments: they are slovenly delinquent in completing their work.
  - ⋆ Finally it may be that some staff are outright criminal in doing their work: They misappropriate funds or steal from the warehouse, etc.
- A whole spectrum of quality thus characterises human work.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Principles 11.70 *Describing the Domain Human Behaviour*

Facets: When describing a domain,

- analyse it with respect to its human behaviour phenomena and concepts.
- Focus on possibly describing these separately.
- Make sure that descriptions of other described domain facets are commensurate with possibly multiple, alternative descriptions of domain human behaviours

. ■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Overall Principles

Characterisation 11.184 By domain *human behaviour* we shall understand

- any of a quality spectrum of carrying out assigned work:
  - ⋆ from *careful*, *diligent* and *accurate*,

  via
  - ⋆ *sloppy* dispatch, and
  - ⋆ *delinquent* work,

  to
  - ⋆ outright *criminal* pursuit

. ■

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- In describing a domain it is important to try capture salient features of what it means to be a human worker:
  - ⋆ being *careful*, *diligent* and *accurate*,
  - ⋆ being unintentionally *sloppy*,
  - ⋆ being intentionally *delinquent*,
  - ⋆ being outright *criminal*

  and, if describable, any shade in-between.
- How
  - ⋆ one describes that,
  - ⋆ and how one, i.e., the software developer, utilises such descriptions
- are covered in more detail later in this lecture.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.150 *Banking — or Programming — Staff Behaviour:*

- Let us assume a bank clerk, "in ye olde" days, when calculating, say mortgage repayments, as illustrated in Example 11.146:
  - ⋆ We would characterise such a clerk as being *diligent*, etc., if that person carefully follows the mortgage calculation rules, and checks and double-checks that calculations "tally up", or lets others do so.
  - ⋆ We would characterise a clerk as being *sloppy* if that person occasionally forgets the checks alluded to above.
  - ⋆ We would characterise a clerk as being *delinquent*

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

if that person systematically forgets these checks.

⋆ And we would call such a person a *criminal* if that person intentionally miscalculates in such a way that the bank (and/or the mortgage client) is cheated out of funds which, instead, may be diverted to the cheater.

- Let us, instead of a bank clerk, assume a software programmer charged with implementing an automatic routine for effecting mortgage repayments along the lines illustrated in Example 11.146:

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- ⋆ We would characterise the programmer as being *diligent* if that person carefully follows the mortgage calculation rules, and throughout the development verifies and tests that the calculations are correct with respect to the rules.
- ⋆ We would characterise the programmer as being *sloppy* if that person forgets certain checks and tests when otherwise correcting the computing program under development.
- ⋆ We would characterise the programmer as being *delinquent* if that person systematically forgets these checks and tests.
- ⋆ And we would characterise the programmer as being a *criminal* if that person intentionally provides a program which miscalculates the mortgage interest, etc., in such a way that the bank (and/or the mortgage client) is cheated out of funds.

Denmark Germany

Example 11.151 *Shopping — Overall Consumer Behaviour:*

- A consumers goods market consists of
  - ⋆ consumers, retailers, wholesalers, producers and delivery services.
- We focus just on possible consumer behaviours:
  - ⋆ (i) a consumer inquires, with a retailer, as to availability, price, and delivery terms, of some merchandise.
  - ⋆ (ii) The retailer responds with zero, one or more offers.
  - ⋆ (iii) The consumer may decide to ignore the offers, or the consumer may select one of the offers, or the consumer may order something that was not in the set of offers.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- ⋆ (iv) The retailer may confirm an order, whereupon delivery takes place and an invoice is sent.
- ⋆ (v) The consumer may decide to return the merchandise unpaid, or even paid!
- ⋆ (vi) Or the consumer may keep the merchandise and may ignore the invoice, or may pay it, or may pay some other "fictive" (i.e., nonexisting) invoice.
- ⋆ (vii) The consumer may then decide to return the merchandise for repair or for claims.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- We narrate in detail the informal points (i–vii) above.
- The consumer function has two internally nondeterministically chosen alternatives.
  - ⋆ Either the initiative is on the side of the consumer (i.e., 'client' mode, shown using "c" prefixed line labels);
  - ⋆ or the consumer "passively" awaits response from the retailer (i.e., 'server' mode, shown using "s" prefixed line labels).

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- (c) As a client the consumer nondeterministically internally, i.e., of her own free will, chooses between doing any of the actions
  - ⋆ (c3) inquire about merchandise,
  - ⋆ (c4) order merchandise ,
  - ⋆ (c5) accept delivery of merchandise believed to have been delivered ,
  - ⋆ (c6) return merchandise believed to have been delivered,
  - ⋆ (c7) pay for merchandise believed to have been delivered,
  - ⋆ (c8) claim refund on supposedly faulty merchandise believed to have been delivered, or
  - ⋆ (c9) ignore whatever goes on!
- Any of these actions (the last is, in effect, a nonaction) does, indeed, leave a side effect, a remembrance, in the mind of the consumer, hence a state change, from **state** to **state′** ((c1)).

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- (s) As a server the consumer
  - ⋆ awaits a response from the retailer.
  - ⋆ If none is forthcoming, the consumer "deadlocks"!
  - ⋆ If a response is forthcoming, it is either
    - ◇ (s4) an offer, possibly prompted by an earlier consumer inquiry — but not necessarily. It could be an "own initiative" by the retailer, or
    - ◇ (s5) a delivery (etc.),
    - ◇ (s6) an invoice (etc.),
    - ◇ (s7) or other!
  - ⋆ In any case, a new state (s2) results.
- The consumer resumes being a consumer in a new state resulting from either her own initiatives, or from externally prompted actions (c11), resp. (s9).

■

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- In the above example we are deliberately leaving many things unspecified (..).
- The point is that we are not so much interested — in this section — in those (..) things.
- We are interested in modelling, in describing, the vagaries of consumers.
- These uncertainties, these unpredictable wanderings, were fully described by the nondeterministic choice
- and by the fact that after the outputs (!) the consumer "recursed" being a consumer without awaiting responses from the retailer.
- It was also shown in our not defining, yet, the handle_xyz(..) clauses.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Example 11.152 *Shopping — Detailed Consumer Behaviour:*

- We left some open points in the earlier example.
- We shall use these to illustrate other aspects of human behaviour, its informal and formal descriptions.
- We start by singling out the treatment of a consumer-initiated initiative, like making an inquiry (c3).

c3 inq → **let** (σ'',i) = .. **in** cr!i ; σ'' **end**

- To (c3) we add the "missing" information about how we form (i.e., "compute") the information (i.e., data) that goes into an inquiry.

c3 inq → **let** (σ'',i) = mki(σ) **in** cr!i ; σ'' **end**

and

value
mki: $\Sigma \to$ Inq Σ

© Dines Bjørner and © Springer
Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- In the formula above we have referred to the action of human "gathering" the information that goes into an inquiry by the cryptic function name **mki**.
- To **m**a**k**e an **i**nquiry we assume that the consumer refers to whatever sense impressions that person may have, and we model that ("whatever sense impressions that person may have") as part of that person's state.
- Hence the gathering action operates on the state and updates it with the fact that the person (whose state it is) has contemplated and formed an inquiry.

- We leave the description of **mki** open.
- Leaving it open also leaves it open to interpretation.
- Anything is allowed that forms an inquiry and possibly changes the state.
- This "openness" models the vagaries of human behaviour.
- The case for all other consumer-initiated actions directed at the retailer is similar to that of the inquiry action in respect of acting upon and communicating information.

© Dines Bjørner and © Springer
Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

- We now treat the case of retailer-initiated interactions.
- Let us consider the consumer's reaction to a retailer offer response.

s4 Ofr(..) → handle_ofr(res)(σ)

- We refer to this reaction by **handle_ofr.**
- As for the making of an inquiry (etc.), this action is not being further described, other than saying:
  - ⋆ It is any action that somehow records,
  - ⋆ in the consumer's state, i.e., mind, or jotted down on a piece of paper,
  - ⋆ say stuck to a kitchen notice board,
  - ⋆ the fact that approximately "such and such" an offer was received.

value
handle_ofr: Ofr → Σ → Σ

- No further action is described.
- In particular, the perhaps expected reaction of the consumer "immediately firing off" an order, or a declination of the offer is not described.
- Any such possible reaction is modelled by the
  - ⋆ internal nondeterministic choices of the
  - ⋆ client actions of the consumer:
  - ⋆ The consumer may, sooner or later or even never
  - ⋆ select or choose an order reply.
  - ⋆ And that order reply may relate, "through" the mko action (c4, not shown),
  - ⋆ to the Offer response (s4).

Methodological Consequences

Techniques 49 *Human Behaviour:*

- (I) We often model the "arbitrariness" of human behaviour by internal nondeterminism.
- There are two concepts to keep clear of one another:
  - ⋆ the user choosing to perform an arbitrary action, act_i, from a set Act, of alternative actions,
  - ⋆ and the interpretation, by the user, or by a system, of that action, b_x, that is, the resulting behaviour.

type
  Act == act_1 | act_2 | ... | act_n | ...
value
  f(...) ≡ ... b_p ⫿ b_s ⫿ b_d ⫿ b_c ...

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- Act denotes a type of action.
- f defines a function which nondeterministically, under no influence from an, or the, environment (i.e., arbitrarily), selects one of the behaviours b_p, b_s, b_d or b_c.
- The, possibly deterministic, meaning of each of the alternatives can then be separately described.
  - ⋆ Proper actions,
    - ◇ act_i: some actually perceivable fruitful action; and (or versus)
  - ⋆ action qualities:
    - ◇ b_p: professional, b_s: sloppy, b_d: delinquent, or b_c: criminal

.

■

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Techniques 50 *Human Behaviour:*

- (II) Alternatively we can model human behaviour by the arbitrary selection of elements from sets and of subsets of sets:

Conceptual Model of Human Behaviour, II

type
  X
value
  hb_i: X-**set** ...→... , hb_i(xs,...) ≡ **let** x:X • x ∈ xs **in** ... **end**
  hb_j: X-**set** ...→... , hb_j(xs,...) ≡ **let** xs′:X-**set** • xs′ ⊆ xs **in** ... **end**

- The above shows just fragments of formal descriptions of those parts which reflect human behaviour.
- Similar, loose descriptions are used when describing faulty supporting technologies, or the "uncertainties" of the intrinsic world

.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Techniques 51 *Human Behaviour (III):*

- Commensurate with the above, humans interpret rules and regulations differently,
- and not always "consistently" — in the sense of repeatedly applying the same interpretations.
- Our final specification pattern is therefore:

type
  Action = Θ $\xrightarrow{\sim}$ Θ-**infset**
value
  hum_int: Rule → Θ → RUL-**infset**
  action: Stimulus → Θ → Θ
  hum_beha: Stimulus × Rules → Action → Θ $\xrightarrow{\sim}$ Θ-**infset**
  hum_beha(sy_sti,sy_rul)(α)(θ) **as** θset
    post
      θset = α(θ) ∧ action(sy_sti)(θ) ∈ θset
       ∧ ∀ θ′:Θ•θ′ ∈ θset ⇒
         ∃ se_rul:RUL•se_rul ∈ hum_int(sy_rul)(θ)⇒se_rul(θ,θ′)

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- The above is, necessarily, sketchy:
  - ⋆ There is a possibly infinite variety of ways of interpreting some rules.
  - ⋆ A human, in carrying out an action, interprets applicable rules and chooses one which that person believes suits some (professional, sloppy, delinquent or criminal) intent.
  - ⋆ "Suits" means that it satisfies the intent,
    - ◇ i.e., yields **true** on the pre/post-configuration pair,
    - ◇ when the action is performed —
    - ◇ whether as intended by the ones who issued the rules and regulations or not.
  - ⋆ We do not cover the case of whether an appropriate regulation is applied or not

.

- The above-stated axioms express how it is in the domain,
- not how we would like it to be.
- For that we have to establish requirements.
- This is the subject of late lectures.

Human Behaviour and Knowledge Engineering

- Domain engineering aims at making precise our understanding of the entities, functions, events and behaviours of the observable phenomena and the intellectual concepts of the domain.
- By *knowledge* we shall, in the narrow context of knowledge engineering, understand that which a human (or a machine, i.e., an agent) knows or believes or assumes or commits with respect to (*knowledge*, *beliefs*, *promises* or *commitments* of) another agent.
- By *knowledge engineering* we shall understand the formulation (whether informal or formal) of such knowledge.

- Knowledge engineering is thus concerned with understanding relations between two or more agents' knowledge (etcetera) about one another with respect to the following issues:
  - ⋆ what does an agent know about what another agent knows or believes;
  - ⋆ which (things) does an agent promise another agent who may then commit or promise other or similar things to yet other agents;
  - ⋆ and so on.
- The subject of knowledge engineering is of importance when we model human behaviour
- but we shall not in this book venture into this very important field of computer and computing science.

Discussion

- Please observe the difference between the version of **meaning** under the rules and regulations facet, and the present version.
  - ⋆ The former reflected the semantics as intended by the stakeholder who issued the rules and regulations.
  - ⋆ The latter reflects the professional or the sloppy or the delinquent or the criminal semantics as intended by the similarly "qualified" staff which carries out the rule-abiding or rule-violating actions.
- Please also observe that we do not here exemplify any regulations.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Reminder

We remind the reader of the principle stated at the outset of this lecture on domain human behaviour:

Principles 11.71 *Describing the Domain Human Behaviour Facets:* When describing a domain,

- analyse it with respect to its human behaviour phenomena and concepts.
- Focus on possibly describing these separately.
- Make sure that descriptions of other described domain facets are commensurate with possibly multiple, alternative descriptions of domain human behaviours

. ■

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Topic 43
Other Domain Facets?

- We have exemplified and formalised some aspects of human behaviour in the domain.
- And we have informally and formally described how we model some aspects of some facets (rules and regulations, respectively human behaviour).
- The latter form some initial contributions to a more proper theory of what we mean by domain facets.

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- The domain facets that we have covered included:
  - ⋆ intrinsics,
  - ⋆ support technologies,
  - ⋆ management and organisation,
  - ⋆ rules and regulations,
  - ⋆ domain scripts and
  - ⋆ human behaviour.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- The question now is obvious:
  - ⋆ Are there other domain facets?
- We refrain, at present, from an answer.
- But we would be surprised if there were not!
- In other words, we expect further practice and further exploratory and experimental research to yield additional facets.
- Thus the course student should be on the look out for whether the facets covered here suffice.
- More generally we must accept the next principle:

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Principle 11.72 *Domain Facets:*

- When modelling, informally or formally, a domain,
- analyse the domain phenomena with respect to whether
- one or another, or a combination of currently identified
- domain facets suffice to model the domain, or
- whether you, the developer, have to discover, i.e.,
- identify, define and otherwise find a suitable set of one or more principles, techniques and tools
- with which to model the domain

.

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

Topic 44

Composition of Domain Models

- From the various facet descriptions the domain engineer
- now has to weave a fabric, and Sect. is about that.
- The domain engineer may also have to formalise the full description, and Sect. is about that.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

Collating Domain Facet Descriptions

General

- The various domain facets can be described more or less individually.
- It is a good idea to try identify and describe these separate facets individually — in other words applying the principle of separate concerns.
- But, in doing so the describer may be repeating some descriptive material unnecessarily.
  - ⋆ Such duplicate material may differ in details and may thus create inconsistencies as well as doubts in the minds of the readers.
- But analysing the domain and describing it on a per facet basis may yield insight and lead to
  - ⋆ discoveries about the domain not otherwise attainable.

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Fredsvej 11 Tiergartenstraße 17
DK-2840 Holte D 69121 Heidelberg
Denmark Germany

A Comprehensive Narrative

- Describing the domain on a per facet basis may lead to a fragmented, staccato (abrupt, disjointed) description.
- To avoid this it may be a good idea to take all the bits and pieces of the various facet descriptions and write them into one whole comprehensive narrative.
- In merging the various facets into one structured narrative the domain engineer may discover possible inconsistencies — and thus will have an early opportunity to correct such.
- The possibly revised (for example corrected) "bits and pieces" should not be thrown away. They can serve as possibly clarifying study material.

From Big Lies via Smaller Lies to the Truth

A Golden Rule of Comprehension Develop your domain understanding — and hence the first round of domain descriptions — by analysing and describing the domain facet-by-facet (including formalisation), then by consolidating this into a more pedagogical and didactical flow of narration (with edited formalisation).

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

© Dines Bjørner Fredsvej 11 DK-2840 Holte Denmark and © Springer Tiergartenstraße 17 D 69121 Heidelberg Germany

- One typical way of structuring a comprehensive narrative, as well as its accompanying formalisations, is to formulate the full narrative as a sequence of narratives.
  - ⋆ Initially the narratives pretend to cover the entire domain,
  - ⋆ starting, obviously with some intrinsics.
  - ⋆ But steps of subsequent narratives enlarge upon the scope,
  - ⋆ choosing pedagogically further domain aspects —
  - ⋆ be they of intrinsic, of support technology, of management and operation, or of the nature of some other domain facets.
  - ⋆ The order chosen is determined by what the writer judges is good didactics and good pedagogics.
  - ⋆ Many such orders are possible.
- We can phrase this unfolding of a narrative as follows:

Phone: +45 4221 2141, E-mail: bjorner@gmail.com, URL: www.imm.dtu.dk/~db

Principles 11.73 The principle of *From Big Lies via Smaller Lies to the Truth*. To achieve a smooth, pedagogically and didactically sound presentation of some universe of discourse,

- start by narrating a suitable lie, call it a big lie, a gross simplification.
- Proceed by adorning the ("false") narration with smaller lies, that is, with less gross simplifications.
- In doing this you have to accommodate it so that the smaller lies fit nicely onto the big lie, that is, that you do not have to change anything in your presentation, only, so to speak, "refine" it.
- Then go on to detail the less gross simplifications, i.e., tell tiny lies while still adhering to the "accommodation principle".
- Finally you have added so much detail that you have told "the truth", that is, what we abstract of the universe of discourse as our truthful abstraction of that universe.

Thus "the limit of all the lies is the truth". ■

Technical Issues

- We saw the need for composing intrinsic descriptions from intrinsic description parts.
- We have now seen, in the lectures on domain facets, through its coverage of many facets, the need for composing from descriptions of separate facets of a domain a comprehensive and consistent description.
- We refer to the use, for example, of RSL's *scheme* facility.
  - ⋆ Non-intrinsic facet schemes can be expressed by *extending* basic (e.g., intrinsic) schemes *with* additional types, values and axioms.
  - ⋆ The *hiding* facility of schemes can likewise be used to express different, but commensurate models.
